

Dynamite—A Bazooka Link?

Three sticks of dynamite, neatly bound with wire and with blasting caps attached, were found 10 blocks from the United Nations yesterday, touching off an intense police investigation to determine whether there was any connection between the dynamite and Friday's bazooka attack on the UN.

The dynamite was found on the rain-soaked pavement at 33rd St. and First Ave., about 10 blocks from the UN complex.

Police said the explosives required an electrical charge to touch them off. Even the pressure of a car going over the dynamite, a detective said, would not have triggered an explosion.

The UN had been the target of a 3.5-inch bazooka shell fired from the Queens side of the East River on Friday. The shot fell about 300 yards short, however, landing in the water.

"It was ready to go," said Detective William Suchowski, of the Bomb Squad. "Whoever had that dynamite

had it arranged for business. I can't see how it could have fallen off a construction truck. If it had been intended for a legitimate purpose it wouldn't have been ready to go."

Ask how much damage the dynamite might have done if the dynamite had been detonated, Detective Suchowski replied . . . "Oh, oh. It would have been something. Just say it would have done a lot of damage."

The dynamite was found by an unidentified man, a child and a woman—believed to be members of the same family. The man carried the dynamite into Kip's Bay Garage and offered it to Robert Connolly, the garage manager, saying, "This looks like dynamite. I found it right outside here. I think you want to do something about it."

Mr. Connolly refused to touch the object, but a garage attendant, Charles Gysin, who had been a construction worker and knew something about dynamite, accepted the

bundle and placed it on a desk.

"Don't put it there," Mr. Connolly protested. So Mr. Gysin took it out of the office and put it on top of a candy vending machine in the garage.

"This man came walking in with the dynamite," Mr. Gysin said. "I believe he may have been coming from the hospital across the street (the New York University Medical Center). The man said he knew it was dynamite because he had used it to blow up stumps. But he thought this was more dynamite than you needed to blow up a stump. It was capped and tied together nicely. It seemed very professional. All it needed was battery charge to set it off. It would have blown off the front of our building and blown up part of the hospital. All it needed was that sting. You could attach it to the starter of a car and that would be the end of the car. I think they got scared and just left it in the street."
